

Siva Naga Ram Avanigadda

Professional Summary:

With 2 years of professional experience in corporate IT, I possess in-depth expertise in cutting-edge Full Stack technologies such as React.js, Next.js, Python, Django, Tailwind CSS, JavaScript, HTML, CSS, and Bootstrap, MySQL. I have a demonstrated history of orchestrating projects from ideation to deployment, ensuring robust performance, scalability, and exceptional user experiences.

Technical Skills:

- Proficient in React.js, Next.js, Python, Django, Tailwind CSS, JavaScript, HTML, CSS, Styled Components, TanStack Router, Vite, React Query, Bootstrap, MySQL.
- Experienced in UI/UX design tools such as Canva, Snapseed, and Figma.
- Hands-on expertise in database management with MySQL and ClickHouse.
- Experienced in utilizing version control systems, including Git, for efficient code management and collaboration.
- Adept at utilizing development environments such as Visual Studio Code, and Pycharm.
- Solid understanding of the full web development lifecycle, from design and development to deployment and maintenance.

Experience: Working as a **Full Stack Developer** in TSSS Infotech & Infra Pvt Ltd, Hyderabad.

Education: Graduated from Yakkati Diwakar & VeenaDevi College, Avanigadda.

Professional Experience:

Project-1: Auto QA Analytics & Recruitment Platform.

Client: UnifyCX - Louisville, Kentucky, US. Mangalore, Karnataka, India.

Role: Frontend Developer

Project Overview:

Developed a data-driven platform combining **Agent performance analytics (Auto QA)** and **Recruitment management module**, enabling organizations to monitor workforce performance, evaluate candidates, and streamline hiring workflows across multiple geographies.

Key Responsibilities:

Auto QA (Agent Performance Analytics Module)

- Built interactive dashboards to analyze agent performance across multiple clients and workflows, enabling real-time visibility into operational metrics.
- Integrated with backend data services powered by ClickHouse to efficiently handle and render high-volume analytics datasets.
- Developed dynamic visualizations (bar charts, line graphs, performance trends) to represent:
 - Call and chat handling metrics
 - SOP adherence
 - Customer interaction quality
- Implemented scoring interfaces to evaluate agent behavior (e.g., greeting quality, compliance and features, empathy) and display performance insights.
- Enabled automated workflows for generating coaching plans based on low performance scores, improving agent productivity and quality standards.

Recruitment & Candidate Assessment Module:

- Built a multi-geo recruitment interface allowing candidates to **apply for jobs across different locations**, improving hiring reach and flexibility.
- Developed data-intensive tables using **AG Grid** to manage and display candidate data, including resumes, application status, and evaluation results.
- Integrated backend services to process and display structured candidate data stored in ClickHouse.
- Implemented recruiter workflows for:
 - Candidate shortlisting
 - Email communication
 - Status tracking (hired/rejected)
- Designed candidate assessment tracking system to:
 - Monitor test progress and completion
 - Manage time-bound assessments
 - Calculate scores and performance metrics
- Built end-to-end visibility into candidate lifecycle from **application → assessment → evaluation → hiring decision**.

Project-2: OCR-Based Document Intelligence Platform.

Client: Point Wild (Pango), Boston, US.

Role: Frontend Developer.

Project Overview:

Developed a scalable web application that processes and extracts structured data from various document types (handwritten, scanned, and digital PDFs) using OCR technology, enabling users to review, validate, and manage extracted information efficiently.

Key Responsibilities

- Built a modular and scalable frontend architecture using **React.js** React.js, TanStack Router, Styled Components, tRPC / REST APIs, Vite to support multiple document workflows and navigation states.
- Integrated OCR and backend APIs to handle **data extraction from handwritten, scanned, and digital documents**, transforming unstructured content into structured formats.
- Designed reusable and maintainable UI components using Styled Components, ensuring consistent design and faster development cycles.
- Developed document review interfaces for:
 - Viewing uploaded files (PDFs, images)
 - Displaying extracted OCR data
 - Editing and validating extracted fields
- Implemented efficient data fetching and caching mechanisms (tRPC / React Query utilities) to improve performance and reduce unnecessary API calls.

Environment: React.js, TypeScript, TanStack Router, Vite, Linaria, Styled Components, tRPC, REST APIs, FastAPI, PostgreSQL, Git, GitHub.
